Dear Editors,

We submit the manuscript “**JobMatch: An Agentic Multi-Role Platform for Explainable Job–Candidate Matching**” for consideration as an **original research regular paper** in the *Journal of Autonomous Agents and Multi-Agent Systems*. The work has not been published previously in archival form and is not under consideration elsewhere.

The paper presents JobMatch, a role-aware multi-agent hiring platform in which Candidate, Employer, and Matchmaking agents coordinate profile ingestion, embedding, and read-only hybrid scoring across separate portals. We believe the manuscript fits JAAMAS because it studies **autonomous and multi-agent system design** in a deployed setting: agents have distinct responsibilities, coordinate through a shared event bus, and support **agentic hiring workflows** while keeping hiring decisions with human users. The Matchmaking agent ranks and explains candidate–job pairs using a composite model (semantic, skill, and constraint signals) rather than acting autonomously on behalf of recruiters or applicants. We pair this architecture with an **empirical offline evaluation** on a labeled corpus of 30 resumes, 15 job postings, and 47 graded relevance pairs, comparing lexical, dense, fusion, and reranking methods with metrics reported from committed benchmark artifacts (e.g., nDCG@5 of 0.969 and 0.968 for the best research drivers; composite ablation nDCG@5 of 0.949). We document an integrated research prototype with reproducible benchmarks tied to deployed code paths, not as a validated production hiring system.

The manuscript follows the structure: Introduction, Literature Review, System Architecture, Methodology, Architectural Realization, Evaluation Framework, Results and Discussion, Conclusion, Future Work, and Declarations.

This manuscript has **not been published previously** in any archival venue, preprint server, or technical report presenting the full paper, and no portion of the text has appeared as a colored-layout preprint. **All authors have reviewed the manuscript and approved this submission.** We declare no competing interests relevant to this work. Data and code availability statements are included in the manuscript declarations.

This work was supported by the NVIDIA Academic Grant Program through an unrestricted gift of 32,000 NVIDIA A100 GPU-hours on the Brev cloud platform. The source code is available at <https://github.com/Harsh23Kashyap/Job-Matching-Agentic>.

Thank you for your consideration.

Sincerely,

Harsh Kashyap and Taranumpreet Kaur Wasu
